## YAG LASER TREATMENT

The YAG laser safely, discreetly, and effectively treats nail fungus, otherwise known as Onychomycosis, for fingernails or toenails. The laser is fungicidal (kills active fungus) for all varieties of nail fungus.

## NAIL FUNGUS RISK FACTORS

Risk factors for nail fungus include nail trauma, athlete's foot, older age, male gender, diabetes, excessive sweating, poor circulation, immune-compromised and chronic exposure to water. Most commonly fingernail and toenail fungus can be contracted at nail salons and locker room showers where fungus spores are found. All nail fungus infections result in thickened, discolored or distorted nails.

There are many species of fungus that can infect the nail. Often in nail infections, several types of fungus will be present at the same time. YAG laser kills all species of live fungus plus yeast, bacteria and molds that cause nail fungus infections. We also treat fungal spores to prevent re-infection, giving you lasting results.

## TREATMENT INFORMATION

You will feel moderate heat during the treatment but there is no recovery time associated with this treatment. Some individuals show rapid improvement, while others show steady improvement. It is our experience that multiple treatments spaced 5 weeks apart are required as well as personal daily care to prevent spores from re-infecting your nail.

## TREATMENT RESULTS
